Chapter 11
The Cardiovascular System

Slides 11.1 – 11.19

Lecture Slides in PowerPoint by Jerry L. Cook
The Cardiovascular System

- A closed system of the heart and blood vessels
  - The heart pumps blood
  - Blood vessels allow blood to circulate to all parts of the body
- The function of the cardiovascular system is to deliver oxygen and nutrients and to remove carbon dioxide and other waste products
The Heart

- Location
  - Thorax between the lungs
  - Pointed apex directed toward left hip
- About the size of your fist
The Heart

Figure 11.1
The Heart: Coverings

- Pericardium – a double serous membrane
  - Visceral pericardium
    - Next to heart
  - Parietal pericardium
    - Outside layer
- Serous fluid fills the space between the layers of pericardium
The Heart: Heart Wall

- Three layers
  - Epicardium
    - Outside layer
    - This layer is the parietal pericardium
    - Connective tissue layer
  - Myocardium
    - Middle layer
    - Mostly cardiac muscle
  - Endocardium
    - Inner layer
    - Endothelium
The Heart: Chambers

- Right and left side act as separate pumps
- Four chambers
  - Atria
    - Receiving chambers
      - Right atrium
      - Left atrium
  - Ventricles
    - Discharging chambers
      - Right ventricle
      - Left ventricle
Blood Circulation

Figure 11.3

KEY:
- Red = Oxygen rich, CO₂-poor blood
- Blue = Oxygen poor, CO₂-rich blood

Capillary beds of all body tissues where gas exchange occurs

Capillary beds of lungs where gas exchange occurs

Pulmonary Circuit
- Pulmonary arteries
- Pulmonary veins
- Aorta and branches

Systemic Circuit
- Venae cavae
- Right atrium
- Right ventricle
- Left atrium
- Left ventricle
The Heart: Valves

- Allow blood to flow in only one direction
- Four valves
  - Atrioventricular valves – between atria and ventricles
    - Bicuspid valve (left)
    - Tricuspid valve (right)
  - Semilunar valves between ventricle and artery
    - Pulmonary semilunar valve
    - Aortic semilunar valve
The Heart: Valves

- Valves open as blood is pumped through
- Held in place by chordae tendineae ("heart strings")
- Close to prevent backflow
Operation of Heart Valves

**Operation of the AV valves**

1. Blood returning to the heart fills atria, putting pressure against atrioventricular valves; the atrioventricular valves are forced open

2. As the ventricles fill, atrioventricular valve flaps hang limply into ventricles

3. Atria contract, forcing additional blood into ventricles

**Operation of the semilunar valves**

As ventricles contract and intraventricular pressure rises, blood is pushed up against semilunar valves, forcing them open

1. Ventricles contract, forcing blood against atrioventricular valve cusps

2. Atrioventricular valves close

3. Chordae tendineae tighten, preventing valve flaps from evertting into atria

As ventricles relax, and intraventricular pressure falls, blood flows back from arteries, filling the cusps of semilunar valves and forcing them to close

Slide 11.12
The Heart: Associated Great Vessels

- Aorta
  - Leaves left ventricle
- Pulmonary arteries
  - Leave right ventricle
- Vena cava
  - Enters right atrium
- Pulmonary veins (four)
  - Enter left atrium
Coronary Circulation

- Blood in the heart chambers does not nourish the myocardium
- The heart has its own nourishing circulatory system
  - Coronary arteries
  - Cardiac veins
  - Blood empties into the right atrium via the coronary sinus
The Heart: Conduction System

- Intrinsic conduction system (nodal system)
  - Heart muscle cells contract, without nerve impulses, in a regular, continuous way
The Heart: Conduction System

- Special tissue sets the pace
  - Sinoatrial node
  - Pacemaker
  - Atrioventricular node
  - Atrioventricular bundle
  - Bundle branches
  - Purkinje fibers
Heart Contractions

- Contraction is initiated by the sinoatrial node
- Sequential stimulation occurs at other autorhythmic cells
Heart Contractions

Figure 11.5

Superior vena cava
Sinoatrial node (pacemaker)
Atrioventricular node
Right atrium
Bundle branches
Purkinje fibers
Atrioventricular bundle (Bundle of His)
Purkinje fibers
Interventricular septum

Filling of Heart Chambers – the Cardiac Cycle

Figure 11.6
The Heart: Cardiac Cycle

- Atria contract simultaneously
- Atria relax, then ventricles contract
- Systole = contraction
- Diastole = relaxation
The Heart: Cardiac Cycle

- Cardiac cycle – events of one complete heart beat
  - Mid-to-late diastole – blood flows into ventricles
  - Ventricular systole – blood pressure builds before ventricle contracts, pushing out blood
  - Early diastole – atria finish re-filling, ventricular pressure is low
The Heart: Cardiac Output

- Cardiac output (CO)
  - Amount of blood pumped by each side of the heart in one minute
  - \( CO = (\text{heart rate } [\text{HR}]) \times (\text{stroke volume } [\text{SV}]) \)

- Stroke volume
  - Volume of blood pumped by each ventricle in one contraction
Cardiac Output Regulation

Parasympathetic nervous system controls (via vagus nerves)

Heart rate (beats/min)

Stroke volume (ml/beat)

Decreased venous return

Crisis has passed

High blood pressure or blood volume

Hormones: epinephrine, thyroxine

Increased contractile force of cardiac muscle

Increased venous return

Decreased blood volume (hemorrhage)

Crisis stressors (physical or emotional trauma, increased body temperature; exercise)

Low blood pressure

Sympathetic nervous system activity

Exercise

Activation of skeletal muscle and respiratory “pumps”

KEY:

Promotes/enhances

Reduces

Figure 11.7
The Heart: Regulation of Heart Rate

- Stroke volume usually remains relatively constant
  - Starling’s law of the heart – the more that the cardiac muscle is stretched, the stronger the contraction
- Changing heart rate is the most common way to change cardiac output
The Heart: Regulation of Heart Rate

- Increased heart rate
  - Sympathetic nervous system
    - Crisis
    - Low blood pressure
  - Hormones
    - Epinephrine
    - Thyroxine
  - Exercise
  - Decreased blood volume
The Heart: Regulation of Heart Rate

- Decreased heart rate
  - Parasympathetic nervous system
  - High blood pressure or blood volume
  - Decreased venous return
Blood Vessels: The Vascular System

- Taking blood to the tissues and back
  - Arteries
  - Arterioles
  - Capillaries
  - Venules
  - Veins
The Vascular System

Figure 11.8b
Blood Vessels: Anatomy

- Three layers (tunics)
  - Tunic intima
    - Endothelium
  - Tunic media
    - Smooth muscle
    - Controlled by sympathetic nervous system
  - Tunic externa
    - Mostly fibrous connective tissue
Differences Between Blood Vessel Types

- Walls of arteries are the thickest
- Lumens of veins are larger
- Skeletal muscle “milks” blood in veins toward the heart
- Walls of capillaries are only one cell layer thick to allow for exchanges between blood and tissue
Movement of Blood Through Vessels

- Most arterial blood is pumped by the heart
- Veins use the milking action of muscles to help move blood
Capillary Beds

- Capillary beds consist of two types of vessels
- Vascular shunt – directly connects an arteriole to a venule

Figure 11.10
Capillary Beds

- True capillaries – exchange vessels
- Oxygen and nutrients cross to cells
- Carbon dioxide and metabolic waste products cross into blood

Figure 11.10
Diffusion at Capillary Beds

Figure 11.20
Major Arteries of Systemic Circulation

- Internal carotid artery
- External carotid artery
- Vertebral artery
- Brachiocephalic artery
- Axillary artery
- Ascending aorta
- Brachial artery
- Abdominal aorta
- Superior mesenteric artery
- Gonadal artery
- Inferior mesenteric artery
- Common iliac artery
- External iliac artery
- Internal iliac artery
- Digital arteries
- Femoral artery
- Popliteal artery
- Anterior tibial artery
- Posterior tibial artery
- Dorsalis pedis
- Arcuate artery

Common carotid arteries
- Subclavian artery
- Aortic arch
- Coronary artery
- Thoracic aorta
- Branches of celiac trunk:
  - Left gastric artery
  - Splenic artery
  - Common hepatic artery
- Renal artery
- Radial artery
- Ulnar artery
- Deep palmar arch
- Superficial palmar arch
- Deep femoral artery

Figure 11.11

Major Veins of Systemic Circulation

- Dural sinuses
- External jugular vein
- Vertebral vein
- Internal jugular vein
- Superior vena cava
- Axillary vein
- Great cardiac vein
- Hepatic veins
- Hepatic portal vein
- Superior mesenteric vein
- Inferior vena cava
- Ulnar vein
- Radial vein
- Common iliac vein
- External iliac vein
- Internal iliac vein
- Digital veins
- Femoral vein
- Great saphenous vein
- Popliteal vein
- Posterior tibial vein
- Anterior tibial vein
- Fibular vein

Basilic vein
Saphenous vein
Median cubital vein
Renal vein
Inferior mesenteric vein

Subclavian vein
Right and left brachiocephalic veins
Cephalic vein
Brachial vein

Figure 11.12

Arterial Supply of the Brain

Figure 11.13

Circle of Willis

- Middle cerebral artery
- Anterior communicating artery
- Posterior communicating artery
- Anterior cerebral artery
- Posterior cerebral artery
- Basilar artery
- Pons
- Occipital lobe of cerebrum
- Vertebral artery
- Cerebellum
- Frontal lobe of cerebrum
- Internal carotid artery
- Pituitary gland
- Temporal lobe

Slide 11.37
Hepatic Portal Circulation

Figure 11.14
Circulation to the Fetus

Figure 11.15

KEY:
- High oxygenation
- Moderate oxygenation
- Low oxygenation
- Very low oxygenation

Pulse

- Pulse – pressure wave of blood
- Monitored at “pressure points” where pulse is easily palpated

Figure 11.16

Copyright © 2003 Pearson Education, Inc. publishing as Benjamin Cummings
Blood Pressure

- Measurements by health professionals are made on the pressure in large arteries
  - Systolic – pressure at the peak of ventricular contraction
  - Diastolic – pressure when ventricles relax
- Pressure in blood vessels decreases as the distance away from the heart increases
Measuring Arterial Blood Pressure

Figure 11.18
Comparison of Blood Pressures in Different Vessels
Blood Pressure: Effects of Factors

- **Neural factors**
  - Autonomic nervous system adjustments (sympathetic division)
- **Renal factors**
  - Regulation by altering blood volume
  - Renin – hormonal control
Blood Pressure: Effects of Factors

- **Temperature**
  - Heat has a vasodilation effect
  - Cold has a vasoconstricting effect

- **Chemicals**
  - Various substances can cause increases or decreases

- **Diet**
Factors Determining Blood Pressure

- Blood volume decreases
- Exercise activates SNS Centers
- Postural changes increase blood viscosity
- Kidney conserves water and salt

Which brings about:
- SV and HR increase
- Vasoconstriction
- Peripheral resistance increases
- Cardiac output increases

Arterial blood pressure increases

↑ = increased
↓ = decreased

Figure 11.19
Variations in Blood Pressure

- Human normal range is variable
  - Normal
    - 140–110 mm Hg systolic
    - 80–75 mm Hg diastolic
  - Hypotension
    - Low systolic (below 110 mm HG)
    - Often associated with illness
  - Hypertension
    - High systolic (above 140 mm HG)
    - Can be dangerous if it is chronic
Capillary Exchange

- Substances exchanged due to concentration gradients
  - Oxygen and nutrients leave the blood
  - Carbon dioxide and other wastes leave the cells
Capillary Exchange: Mechanisms

- Direct diffusion across plasma membranes
- Endocytosis or exocytosis
- Some capillaries have gaps (intercellular clefts)
  - Plasma membrane not joined by tight junctions
- Fenestrations of some capillaries
  - Fenestrations = pores
Developmental Aspects of the Cardiovascular System

- A simple “tube heart” develops in the embryo and pumps by the fourth week
- The heart becomes a four-chambered organ by the end of seven weeks
- Few structural changes occur after the seventh week
